

Memory diagram

Storage of class

	location	init.
auto	stack	garbage value
extern	data section	0
static		0
register	CPU register	garbage value

Dynamic memory allocation

```
int *arr;
arr = (int *) malloc(Size * Size of (int));
free(arr);
realloc(arr, (n+1)*sizeof(int));
```

↓
calloc (size, size of (int));
calloc (size, sizeof(int))
realloc (arr, (n+1)*sizeof(int))
↓
(to change size)

Dynamic memory allocation for 2D array

with known (fixed) row & unknown (variable) column
can be allocated in different memory as set of
columns with known row size & address of
each can be stored in pointer array.

```
int *arr[3];
```

09-09-2024

Structure & Union → only one member
can be used at
shared memory by all
typedef → using pointer

```
enum <tag name> {m1, m2, ..., mn};
enum days-of-week {Sun, Mon, Tue, Wed, Thu, Fri, Sat};
enum days-of-week day;
day = 'Wed';
```

typedef <struct> val list C
(int a, ...)

11-09-2024 File Handling
read, write, append, close
rb wb ab → BIN
at → read/write

```
rewind(*);
```

```
long ftell (*);
fseek (*, length, SEEK.END, SEEK.SET, SEEK.CUR)
```

12-09-2024

Object oriented programming → Abstraction
Encapsulation
Inheritance
Polymorphism

iostream → cin } objects
cout }

>> extraction operator
<< insertion operator

namespace <name> C++
reference variable
const →
inline function
function overloading

1 - initialize array

for (loop is immediate through each element in array)

```

2- {
    get input from user in array
}

```

3- for (loop is same, since through each element in array)

```

{
    display value of array at the index
}

```

String copy

```

for (i=0; str1[i]!='\0'; i++)
{

```

strcpy

```

    for (i=0; str2[i]!='\0'; i++)
    {
        str1[i] = str2[i]
    }
    str1[i] = '\0';

```

printf (i)

str concatenation

```

str1 = str1 + str2
for (i=0; str2[i]!='\0'; str1.length++);
for (i=0; str2[i]!='\0'; i++)
{
    str1[str1.length] = str2[i];
}
str1[i] = '\0';

```

reverse

→ str.cmp

while (getchar() != '\n');

18-09-2024

Linux Shell scripting & Python

Kernel → manages resources

BIOS → MBR → GRUB → Kernel
(loader)

RAM & Swap (locking store)

Virtual memory

Run levels

- 0 → system halted
- 1 → single user mode
- 2 → multiuser mode without network
- 3 → 2 + networking
- 4 → unused
- 5 → 3 + GUI
- 6 → Reboot

In Terminal

\$ - normal user.
- root user
~ - home-dir
Linux commands

man
→ no. man for DOS commands.

uid: 0-999 → system specific user
-1000+ → normal user → where is (bin)

group - group of user with similar permission

nl
wc -w
diff
chmod
down
pc

23-09-2024

. user.add
→ /etc/passwd ⇒ 1 line/user
→ /etc/shadow ⇒ new user get added at end

* /home not gets created in Ubuntu

→ /etc/group
→ group with same name gets created when add user.

26/09/2024
sh → shell /bin/sh
csh → C program /bin/csh
bash → Bourne again shell /bin/bash

Permission

rwX --- --
owner group other

usermod

/etc/skel → skeleton

.bashrc → run command

#!/bin/bash

'capital' ⇒ global variable (export) for application to use

'small' ⇒ local variable

number
@ includes [lit.]
* includes [strings]

if - eq
- gt

if - then it

while

for -- done

-f -d
file "directory"

((i++)) {a...z}

Brace expansion

a{b,c}d

abd acd
str=123456

range string

P334-36

305, 309

269-278

Shell scripting Bible

27-09-2024

? - exit status

\$ - process id

set -- □ □ □
parameter

check file permission.

grep -v
-i
-R

in add
ip link

wc -w
-L

3 7 11 15 19

W → V

Python

list = []
- different datatypes

tuple = () immutable → can add to new

set = set() { } mutable

Splitting

Function

Definition. default parameter.

(named parameters), positional parameter
keyword parameter

Class

- init -
super()
formatted print

⇒ class ParentClass:
def __init__(self, ...):
self... = ...

class Child(Parent):

parent.__init__() = ()
super().__init__(...) # same as object creation

Python, shell scripting

1. Using switch case display accept 2 different parameter.. file exits,

2. directory exists

3. count files in directory

4. Invalid choice.

2 class, Parent → child

def display(first, last) → of a []

def count('a') → count ()
↳ index

if len
def reverse

Regex

re.search('r')

re.findall('r', 'abc')

re.split('r', 'abc')

re.split('r', 'abc', 1)

↳ no of occurrence

re.sub('org', 'store', 'example.org')
